

WRONG mutex implementation

```
std::atomic<int> state = UNLOCKED; // 0
```

```
void lock() {
```

```
    while (state.load() == LOCKED) { }
```

```
    state.store(LOCKED);
```

```
}
```

```
void unlock() {
```

```
    state.store(UNLOCKED);
```

```
}
```

read, modify, write is
not atomic

CORRECT mutex implementation

```
std::atomic<int> state = UNLOCKED;
```

```
void lock() {
```

```
    while (state++ != LOCKED) {
```

```
        --state;
```

```
    }
```

```
}
```

```
void unlock() {
```

```
    --state;
```

```
}
```

equivalent to

```
while (state++ != UNLOCKED) {
```

```
    state--;
```

```
}
```

Bounded Buffer

* want reader and writer to act independently

1. capacity
2. position of next byte to read
3. position of next byte to write

2 "try again" conditions:

1. partially wrote
2. didn't write anything

— 54

Condition variables

solve wake up / sleep problem

bbuf

--	--	--	--	--

bbuf.write("ABCDE", 5) → 4

bbuf.write("EFGH")

bbuf.write("IJKL")

bbuf.read(x, 3)

bbuf.read(x, 3)

bbuf.read(x, 3)
